

Hydrocodone bitartrate and homatropine methylbromide tablets and oral solution

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use hydrocodone bitartrate and homatropine methylbromide safely and effectively. See full prescribing information for hydrocodone bitartrate and homatropine methylbromide.

Hydrocodone bitartrate and homatropine methylbromide tablets, for oral use, CII

Hydrocodone bitartrate and homatropine methylbromide oral solution, CII

Initial U.S. Approval: 1943

WARNING: ADDICTION, ABUSE, AND MISUSE; LIFE-THREATENING RESPIRATORY DEPRESSION; ACCIDENTAL INGESTION; MEDICATION ERRORS; CYTOCHROME P450 3A4 INTERACTION; CONCOMITANT USE WITH BENZODIAZEPINES OR OTHER CNS DEPRESSANTS; INTERACTION WITH ALCOHOL; NEONATAL OPIOID WITHDRAWAL SYNDROME

See full prescribing information for complete boxed warning.

- Hydrocodone bitartrate and homatropine methylbromide exposes users to risks of addiction, abuse, and misuse, which can lead to overdose and death. Assess patient's risk before prescribing and monitor closely for these behaviors and conditions. (5.1)
- Serious, life-threatening, or fatal respiratory depression may occur. Monitor closely, especially upon initiation or when used in patients at higher risk. (5.2)

- Accidental ingestion of hydrocodone bitartrate and homatropine methylbromide, especially by children, can result in a fatal overdose of hydrocodone. (5.2)

- Ensure accuracy when prescribing, dispensing, and administering hydrocodone bitartrate and homatropine methylbromide. Dosing errors can result in accidental overdose and death. (2.1, 5.5)

- Concomitant use with CYP3A4 inhibitors (or discontinuation of CYP3A4 inducers) can result in a fatal overdose of hydrocodone. Avoid the use of hydrocodone bitartrate and homatropine methylbromide in patients taking CYP3A4 inhibitors or inducers. (5.7, 7.2, 7.3)

- Concomitant use of opioids with benzodiazepines or other central nervous system (CNS) depressants, including alcohol, may result in profound sedation, respiratory depression, coma, and death. Avoid the use of hydrocodone bitartrate and homatropine methylbromide in patients taking benzodiazepines, other CNS depressants, or alcohol. (5.8, 8.7, 9.4)

- Instruct patients not to consume alcohol or any products containing alcohol while taking hydrocodone bitartrate and homatropine methylbromide because co-ingestion can result in fatal plasma hydrocodone levels. (5.8, 7.1)

- Hydrocodone bitartrate and homatropine methylbromide is not recommended for use in pregnant women. Prolonged use of hydrocodone bitartrate and homatropine methylbromide during pregnancy can result in neonatal opioid withdrawal syndrome, which may be life-threatening if not recognized and treated. If hydrocodone bitartrate and homatropine methylbromide is used for a prolonged period in a pregnant woman, advise the patient of the risk of neonatal opioid withdrawal syndrome and ensure that appropriate treatment will be available. (5.13, 8.1)

RECENT MAJOR CHANGES

Dosage and Administration (2.2) 04/2021

INDICATIONS AND USAGE

Hydrocodone bitartrate and homatropine methylbromide is a combination of hydrocodone, an opioid agonist; and homatropine, a muscarinic antagonist, indicated for the symptomatic relief of cough in adult patients 18 years of age and older. (1)

Limitations of Use (1)

- Not indicated for pediatric patients under 18 years of age.
- Because of the risks of addiction, abuse, and misuse with opioids, even at recommended doses, reserve hydrocodone bitartrate and homatropine methylbromide for use in adult patients for whom the benefits of cough suppression are expected to outweigh the risks, and in whom an adequate assessment of the etiology of the cough has been made.

WARNING: ADDICTION, ABUSE, AND MISUSE; LIFE-THREATENING RESPIRATORY DEPRESSION; ACCIDENTAL INGESTION; MEDICATION ERRORS; CYTOCHROME P450 3A4 INTERACTION; CONCOMITANT USE WITH BENZODIAZEPINES OR OTHER CNS DEPRESSANTS; INTERACTION WITH ALCOHOL; NEONATAL OPIOID WITHDRAWAL SYNDROME

1 INDICATIONS AND USAGE

2 DOSAGE AND ADMINISTRATION

- Important Dosage and Administration Instructions
- Recommended Dosage
- Monitoring, Maintenance, and Discontinuation of Therapy

3 DOSAGE FORMS AND STRENGTHS

4 CONTRAINDICATIONS

5 WARNINGS AND PRECAUTIONS

- Addiction, Abuse, and Misuse
- Life-Threatening Respiratory Depression
- Risks with Use in Pediatric Populations
- Risks with Use in Other At-Risk Populations
- Risks of Accidental Overdose and Death due to Medication Errors
- Activities Requiring Mental Alertness: Risks of Driving and Operating Machinery
- Risks from Concomitant Use or Discontinuation of Cytochrome P450 3A4 Inhibitors and Inducers
- Risks from Concomitant Use with Benzodiazepines or other CNS Depressants
- Risks of Use in Patients with Gastrointestinal Conditions
- Risks of Use in Patients with Head Injury, Impaired Consciousness, Increased Intracranial Pressure, or Brain Tumors
- Increased Risk of Seizures in Patients with Seizure Disorders
- Severe Hypotension
- Neonatal Opioid Withdrawal Syndrome
- Adrenal Insufficiency
- Drug/Laboratory Test Interactions

DOSAGE AND ADMINISTRATION

- Adults 18 years of age and older: One (1) tablet or 5 mL of the oral solution every 4 to 6 hours as needed; not to exceed six (6) tablets or 30 mL in 24 hours. (2.2)
- Measure hydrocodone bitartrate and homatropine methylbromide oral solution with an accurate milliliter measuring device. (2.1, 5.5)
- Do not increase the dose or dosing frequency. (2.1)
- Prescribe for the shortest duration consistent with treatment goals. (2.3)
- Reevaluate patients with unresponsive cough in 5 days or sooner for possible underlying pathology. (2.3)
- Reevaluate patient prior to refilling. (2.3)

DOSAGE FORMS AND STRENGTHS

- Tablets: 5 mg of hydrocodone bitartrate and 1.5 mg of homatropine methylbromide per tablet. (3)
- Oral solution: 5 mg of hydrocodone bitartrate and 1.5 mg of homatropine methylbromide per 5 mL. (3)

CONTRAINDICATIONS

- Children younger than 6 years of age. (4)
- Significant respiratory depression. (4)
- Acute or severe bronchial asthma in an unmonitored setting or in absence of resuscitative equipment. (4)
- Known or suspected gastrointestinal obstruction, including paralytic ileus. (4)
- Hypersensitivity to hydrocodone, homatropine, or any of the inactive ingredients in hydrocodone bitartrate and homatropine methylbromide. (4)

WARNINGS AND PRECAUTIONS

- Life-threatening respiratory depression in patients with chronic pulmonary disease or in elderly, cachectic, or debilitated patients: Monitor closely, particularly during initiation of therapy. (5.4)
- Activities requiring mental alertness: Avoid engaging in hazardous tasks requiring mental alertness such as driving or operating machinery. (5.6)
- Risks of use in patients with head injury, impaired consciousness, increased intracranial pressure, or brain tumors: Avoid use. May increase intracranial pressure and obscure the clinical course of head injuries. (5.10)
- Seizures in patients with seizure disorders: Monitor during therapy. (5.11)
- Severe hypotension: Monitor during initiation of therapy. Avoid use in patients with circulatory shock. (5.12)
- Adrenal insufficiency: If diagnosed, treat with physiologic replacement of corticosteroids, and wean patient off of the opioid. (5.14)
- Activities requiring mental alertness: Avoid engaging in hazardous tasks requiring mental alertness such as driving or operating machinery. (5.6)
- Risks of use in patients with head injury, impaired consciousness, increased intracranial pressure, or brain tumors: Avoid use. May increase intracranial pressure and obscure the clinical course of head injuries. (5.10)
- Seizures in patients with seizure disorders: Monitor during therapy. (5.11)
- Severe hypotension: Monitor during initiation of therapy. Avoid use in patients with circulatory shock. (5.12)
- Adrenal insufficiency: If diagnosed, treat with physiologic replacement of corticosteroids, and wean patient off of the opioid. (5.14)

ADVERSE REACTIONS

Common adverse reactions include: Sedation (somnolence, mental clouding, lethargy), impaired mental and physical performance, lightheadedness, dizziness, headache, dry mouth, nausea, vomiting, and constipation. (6)

To report SUSPECTED ADVERSE REACTIONS, contact Pharm-Clam at 1-866-511-6754 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

DRUG INTERACTIONS

- Serotonergic Drugs: Concomitant use may result in serotonin syndrome. Discontinue if serotonin syndrome is suspected. (7.5)
- Monoamine Oxidase Inhibitors (MAOIs): Can potentiate the effects of hydrocodone. Avoid concomitant use in patients receiving MAOIs or within 14 days of stopping an MAOI. (7.6)
- Muscle Relaxants: Avoid concomitant use. (7.7)
- Diuretics: Hydrocodone may reduce the efficacy of diuretics. Monitor for reduced effect. (7.8)
- Anticholinergic drugs: Concurrent use may cause paralytic ileus. (5.9, 7.9)

USE IN SPECIFIC POPULATIONS

- Pregnancy: Avoid use in pregnant women. May cause fetal harm. (8.1)
- Lactation: Breastfeeding not recommended. (8.2)
- Renal Impairment: Use with caution in patients with severe renal impairment. (8.6)
- Hepatic Impairment: Use with caution in patients with severe hepatic impairment. (8.7)

16 HOW SUPPLIED/STORAGE AND HANDLING

17 PATIENT COUNSELING INFORMATION

*Sections or subsections omitted from the full prescribing information are not listed.

FULL PRESCRIBING INFORMATION

WARNING: ADDICTION, ABUSE, AND MISUSE; LIFE-THREATENING RESPIRATORY DEPRESSION; ACCIDENTAL INGESTION; MEDICATION ERRORS; CYTOCHROME P450 3A4 INTERACTION; CONCOMITANT USE WITH BENZODIAZEPINES OR OTHER CNS DEPRESSANTS; INTERACTION WITH ALCOHOL; NEONATAL OPIOID WITHDRAWAL SYNDROME

Addiction, Abuse, and Misuse

Hydrocodone bitartrate and homatropine methylbromide exposes patients and other users to the risks of opioid addiction, abuse, and misuse, which can lead to overdose and death. Reserve hydrocodone bitartrate and homatropine methylbromide for use in adult patients for whom the benefits of cough suppression are expected to outweigh the risks, and in whom an adequate assessment of the etiology of the cough has been made. Assess each patient's risk prior to prescribing hydrocodone bitartrate and homatropine methylbromide, prescribe hydrocodone bitartrate and homatropine methylbromide for the shortest duration that is consistent with individual patient treatment goals, monitor all patients regularly for the development of addiction or abuse, and refill only after reevaluation of the need for continued treatment [see Warnings and Precautions (5.1)].

Life-Threatening Respiratory Depression

Serious, life-threatening, or fatal respiratory depression may occur with use of hydrocodone bitartrate and homatropine methylbromide. Monitor for respiratory depression, especially during initiation of hydrocodone bitartrate and homatropine methylbromide therapy or when used in patients at higher risk [see Warnings and Precautions (5.2)].

Accidental Ingestion

Accidental ingestion of even one dose of hydrocodone bitartrate and homatropine methylbromide, especially by children, can result in a fatal overdose of hydrocodone [see Warnings and Precautions (5.2)].

Risk of Medication Errors

Ensure accuracy when prescribing, dispensing, and administering hydrocodone bitartrate and homatropine methylbromide. Dosing errors can result in accidental overdose and death. Always use an accurate milliliter measuring device when measuring and administering hydrocodone bitartrate and homatropine methylbromide oral solution [see Dosage and Administration (2.1), Warnings and Precautions (5.5)].

Cytochrome P450 3A4 Interaction

The concomitant use of hydrocodone bitartrate and homatropine methylbromide with all cytochrome P450 3A4 inhibitors may result in an increase in hydrocodone plasma concentrations, which could increase or prolong adverse drug effects and may cause potentially fatal respiratory depression. In addition, discontinuation of a concomitantly used cytochrome P450 3A4 inducer may result in an increase in hydrocodone plasma concentration. Avoid the use of hydrocodone bitartrate and homatropine methylbromide in patients taking a CYP3A4 inhibitor or inducer [see Warnings and Precautions (5.7), Drug Interactions (7.2, 7.3)].

Risks from Concomitant Use with Benzodiazepines or Other CNS Depressants

Concomitant use of opioids with benzodiazepines or other central nervous system (CNS) depressants, including alcohol, may result in profound sedation, respiratory depression, coma, and death. Avoid the use of hydrocodone bitartrate and homatropine methylbromide in patients taking benzodiazepines, other CNS depressants, or alcohol [see Warnings and Precautions (5.8), Drug Interactions (7.5)].

Interaction with Alcohol

Instruct patients not to consume alcoholic beverages or use prescription or non-prescription products that contain alcohol while taking hydrocodone bitartrate and homatropine methylbromide. The co-ingestion of alcohol with hydrocodone bitartrate and homatropine methylbromide may result in increased plasma levels and a potentially fatal overdose of hydrocodone [see Warnings and Precautions (5.8), Drug Interactions (7.1)].

Neonatal Opioid Withdrawal Syndrome

Hydrocodone bitartrate and homatropine methylbromide is not recommended for use in pregnant women [see Use in Specific Populations (8.1)]. Prolonged use of hydrocodone bitartrate and homatropine methylbromide during pregnancy can result in neonatal opioid withdrawal syndrome, which may be life-threatening if not recognized and treated, and requires management according to protocols developed by neonatology experts. If hydrocodone bitartrate and homatropine methylbromide is used for a prolonged period in a pregnant woman, advise the patient of the risk of neonatal opioid withdrawal syndrome and ensure that appropriate treatment will be available [see Warnings and Precautions (5.13)].

1 INDICATIONS AND USAGE

Hydrocodone bitartrate and homatropine methylbromide is indicated for the symptomatic relief of cough in adult patients 18 years of age and older.

Limitations of Use:

- Not indicated for pediatric patients under 18 years of age [see Use in Specific Populations (8.4)].
- Contraindicated in pediatric patients less than 6 years of age [see Contraindications (4)].
- Because of the risks of addiction, abuse, and misuse with opioids, even at recommended doses, reserve hydrocodone bitartrate and homatropine methylbromide for use in adult patients for whom the benefits of cough suppression are expected to outweigh the risks, and in whom an adequate assessment of the etiology of the cough has been made.

2 DOSAGE AND ADMINISTRATION

2.1 Important Dosage and Administration Instructions

Administer hydrocodone bitartrate and homatropine methylbromide by the oral route only. Always use an accurate milliliter measuring device when administering hydrocodone bitartrate and homatropine methylbromide oral solution to ensure that the dose is measured and administered accurately. A household teaspoon is not an accurate measuring device and could lead to overdose [see Warnings and Precautions (5.5)]. For prescriptions where a measuring device is not provided, a pharmacist can provide an appropriate measuring device and can provide instructions for measuring the correct dose. Do not overfill. Rinse the measuring device with water after each use.

Advise patients not to increase the dose or dosing frequency of hydrocodone bitartrate and homatropine methylbromide because serious adverse events such as respiratory depression may occur with overdose [see Warnings and Precautions (5.2), Overdose (10)]. The dosage of hydrocodone bitartrate and homatropine methylbromide should not be increased if cough fails to respond; an unresponsive cough should be reevaluated for possible underlying pathology [see Dosage and Administration (2.3), Warnings and Precautions (5.4)].

2.2 Recommended Dosage

Adults 18 years of age and older: One (1) tablet or 5 mL of the oral solution every 4 to 6 hours as needed; not to exceed six (6) tablets or 30 mL in 24 hours.

2.3 Monitoring, Maintenance, and Discontinuation of Therapy

- Prescribe hydrocodone bitartrate and homatropine methylbromide for the shortest duration that is consistent with individual patient treatment goals [see Warnings and Precautions (5.1)].
- Monitor patients closely for respiratory depression, especially within the first 24 to 72 hours of initiating therapy [see Warnings and Precautions (5.2)].
- Reevaluate patients with unresponsive cough in 5 days or sooner for possible underlying pathology, such as foreign body or lower respiratory tract disease [see Warnings and Precautions (5.4)]. If a patient requires a refill, reevaluate the cause of the cough and assess the need for continued treatment with hydrocodone bitartrate and homatropine methylbromide, the relative incidence of adverse reactions, and the development of addiction, abuse, or misuse [see Warnings and Precautions (5.1)].

- Do not abruptly discontinue hydrocodone bitartrate and homatropine methylbromide in a physically-dependent patient [see Drug Abuse and Dependence (9.3)]. When a patient who has been taking hydrocodone bitartrate and homatropine methylbromide regularly and may be physically dependent no longer requires therapy with hydrocodone bitartrate and homatropine methylbromide, taper the dose gradually, by 25% to 50% every 2 to 4 days, while monitoring carefully for signs and symptoms of withdrawal. If the patient develops these signs or symptoms, raise the dose to the previous level and taper more slowly, either by increasing the interval between decreases, decreasing the amount of change in dose, or both.

3 DOSAGE FORMS AND STRENGTHS

- Tablets: 5 mg of hydrocodone bitartrate and 1.5 mg of homatropine methylbromide per tablet, white colored, biconvex, one face bisected and debossed with "205", and the other face plain [see Description (11)].
- Oral solution: 5 mg of hydrocodone bitartrate and 1.5 mg of homatropine methylbromide per 5 mL, a clear red-colored, cherry-flavored [see Description (11)].

4 CONTRAINDICATIONS

Hydrocodone bitartrate and homatropine methylbromide is contraindicated for:

- All pediatric patients younger than 6 years of age [see Warnings and Precautions (5.2, 5.3), Use in Specific Populations (8.4)].
- Significant respiratory depression [see Warnings and Precautions (5.2)].
- Acute or severe bronchial asthma in an unmonitored setting or in the absence of resuscitative equipment [see Warnings and Precautions (5.4)].
- Known or suspected gastrointestinal obstruction, including paralytic ileus [see Warnings and Precautions (5.9)].
- Hypersensitivity to hydrocodone, homatropine, or any of the inactive ingredients in hydrocodone bitartrate and homatropine methylbromide [see Adverse Reactions (6)].

5 WARNINGS AND PRECAUTIONS

5.1 Addiction, Abuse, and Misuse

Hydrocodone bitartrate and homatropine methylbromide contains hydrocodone, a Schedule II controlled substance. As an opioid, hydrocodone bitartrate and homatropine methylbromide exposes users to the risks of addiction, abuse, and misuse [see Drug Abuse and Dependence (9)], which can lead to overdose and death [see Overdose (10)].

Reserve hydrocodone bitartrate and homatropine methylbromide for use in adult patients for whom the benefits of cough suppression are expected to outweigh the risks, and in whom an adequate assessment of the etiology of the cough has been made.

Assess each patient's risk prior to prescribing hydrocodone bitartrate and homatropine methylbromide, prescribe hydrocodone bitartrate and homatropine methylbromide for the shortest duration that is consistent with individual patient treatment goals, monitor all patients regularly for the development of addiction or abuse, and refill only after reevaluation of the need for continued treatment.

Although the risk of addiction in any individual is unknown, it can occur in patients appropriately prescribed hydrocodone bitartrate and homatropine methylbromide. Addiction can occur at recommended doses and if the drug is misused or abused. Risks are increased in patients with a personal or family history of substance abuse (including drug or alcohol abuse or addiction) or mental illness (e.g., major depression).

- Opioids are sought by drug abusers and people with addiction disorders and are subject to criminal diversion. Consider these risks when prescribing or dispensing hydrocodone bitartrate and homatropine methylbromide. Strategies to reduce these risks include prescribing the drug in the smallest appropriate quantity and advising the patient on the proper disposal of unused drug [see Patient Counseling Information (17)]. Contact local state professional licensing board or state controlled substances authority for information on how to prevent and detect abuse or diversion of this product.

5.2 Life-Threatening Respiratory Depression

Serious, life-threatening, or fatal respiratory depression has been reported with the use of opioids, including hydrocodone, one of the active ingredients in hydrocodone bitartrate and homatropine methylbromide. Hydrocodone produces dose related respiratory depression by directly acting on the brain stem respiratory center that controls respiratory rhythm and may produce irregular and periodic breathing. Respiratory depression, if not immediately recognized and treated, may lead to respiratory arrest and death. Management of respiratory depression includes discontinuation of hydrocodone bitartrate and homatropine methylbromide, close observation, supportive measures, and use of opioid antagonists (e.g., naloxone), depending on the patient's clinical status [see Overdose (10)]. Carbon dioxide (CO₂) retention from opioid-induced respiratory depression can exacerbate the sedating effects of opioids.

- While serious, life-threatening, or fatal respiratory depression can occur at any time during the use of hydrocodone bitartrate and homatropine methylbromide, the risk is greatest during the initiation of therapy, when hydrocodone bitartrate and homatropine methylbromide is used concomitantly with other drugs that may cause respiratory depression, and in patients with chronic respiratory disease who have respiratory depression or decreased respiratory reserve, and in patients with altered pharmacokinetics or altered clearance (e.g., elderly, cachectic, or debilitated patients) [see Warnings and Precautions (5.4)].
- To reduce the risk of respiratory depression, proper dosing of hydrocodone bitartrate and homatropine methylbromide is essential [see Dosage and Administration (2.1), Warnings and Precautions (5.3)]. Monitor patients closely, especially within the first 24 to 72 hours of initiating therapy or when used in patients at higher risk.

- Overdose of hydrocodone in adults has been associated with fatal respiratory depression, and the use of hydrocodone in pediatric patients younger than 18 years of age is contraindicated [see Contraindications (4)].

5.3 Risks with Use in Pediatric Populations

- Pediatric patients are particularly sensitive to the respiratory depressant effects of hydrocodone [see Warnings and Precautions (5.2)]. Because of the risk of life-threatening respiratory depression and death, hydrocodone bitartrate and homatropine methylbromide is contraindicated in pediatric patients less than 6 years of age [see Contraindications (4)].
- Use of hydrocodone bitartrate and homatropine methylbromide in pediatric patients also exposes them to the risks of addiction, abuse, and misuse [see Drug Abuse and Dependence (9)], which can lead to overdose and death [see Warnings and Precautions (5.1), Overdose (10)]. Because the benefits of symptomatic treatment of cough associated with allergies or the common cold do not outweigh the risks of use of hydrocodone in pediatric patients, hydrocodone bitartrate and homatropine methylbromide is not indicated for use in patients younger than 18 years of age [see Indications (1), Use in Specific Populations (8.4)].

5.4 Risks with Use in Other At-Risk Populations

The dosage of hydrocodone bitartrate and homatropine methylbromide should not be increased if cough fails to respond; an unresponsive cough should be reevaluated in 5 days or sooner for possible underlying pathology, such as foreign body or lower respiratory tract disease [see Dosage and Administration (2.3)].

Asthma and Other Pulmonary Disease

- The use of hydrocodone bitartrate and homatropine methylbromide in patients with acute or severe bronchial asthma in an unmonitored setting or in the absence of resuscitative equipment is contraindicated [see Contraindications (4)].
- Opioid analgesics and antitussives, including hydrocodone, one of the active ingredients in hydrocodone bitartrate and homatropine methylbromide, should not be used in patients with acute febrile illness associated with productive cough or in patients with chronic respiratory disease where interference with ability to clear the tracheobronchial tree of secretions would have a deleterious effect on the patient's respiratory status [see Warnings and Precautions (5.2)].
- Hydrocodone bitartrate and homatropine methylbromide-treated patients with significant chronic obstructive pulmonary disease or cor pulmonale, and those with a substantially decreased respiratory reserve, hypoxia, hypercapnia, or pre-existing respiratory depression are at increased risk of decreased respiratory drive including apnea, even at recommended dosages of hydrocodone bitartrate and homatropine methylbromide [see Warnings and Precautions (5.2)].

Elderly, Cachectic, or Debilitated Patients

- Life-threatening respiratory depression is more likely to occur in elderly, cachectic, or debilitated patients because they may have altered pharmacokinetics or altered clearance compared to younger, healthier patients [see Warnings and Precautions (5.2)].
- Because of the risk of respiratory depression, avoid the use of opioid antitussives, including hydrocodone bitartrate and homatropine methylbromide in patients with compromised respiratory function, patients at risk of respiratory failure, and in elderly, cachectic, or debilitated patients. If hydrocodone bitartrate and homatropine methylbromide is prescribed, monitor such patients closely, particularly when initiating hydrocodone bitartrate and homatropine methylbromide and when hydrocodone bitartrate and homatropine methylbromide is given concomitantly with other drugs that depress respiration [see Warnings and Precautions (5.8)].

5.5 Risk of Accidental Overdose and Death due to Medication Errors

- Dosing errors can result in accidental overdose and death. To reduce the risk of overdose and respiratory depression, ensure that the dose of hydrocodone bitartrate and homatropine methylbromide is communicated clearly and dispensed accurately [see Dosage and Administration (2.1)].
- Advise patients to always use an accurate milliliter measuring device when measuring and administering hydrocodone bitartrate and homatropine methylbromide oral solution. Inform patients that household teaspoons is not an accurate measuring device and could lead to overdose [see Warnings and Precautions (5.5)]. For prescriptions where a measuring device is not provided, a pharmacist can provide an appropriate calibrated measuring device and can provide instructions for measuring the correct dose.

5.6 Activities Requiring Mental Alertness: Risks of Driving and Operating Machinery

Hydrocodone, one of the active ingredients in hydrocodone bitartrate and homatropine methylbromide, may produce marked drowsiness and impair the mental and/or physical abilities required for the performance of potentially hazardous tasks such as driving a car or operating machinery. Advise patients to avoid engaging in hazardous tasks requiring mental alertness and motor coordination after ingestion of hydrocodone bitartrate and homatropine methylbromide. Avoid concurrent use of hydrocodone bitartrate and homatropine methylbromide with alcohol or other central nervous system depressants because additional impairment of central nervous system performance may occur [see Warnings and Precautions (5.8)].

5.7 Risks from Concomitant Use or Discontinuation of Cytochrome P450 3A4 Inhibitors and Inducers

- Concomitant use of hydrocodone bitartrate and homatropine methylbromide with a CYP3A4 inhibitor, such as macrolide antibiotics (e.g., erythromycin), azole antifungal agents (e.g., ketoconazole), and protease inhibitors (e.g., ritonavir), may increase plasma concentrations of hydrocodone and prolong opioid adverse reactions, which may cause potentially fatal respiratory depression [see Warnings and Precautions (5.2)], particularly in patients with respiratory depression. Similarly, discontinuation of a CYP3A4 inducer, such as rifampin, carbamazepine, and phenytoin, in hydrocodone bitartrate and homatropine methylbromide-treated patients may increase hydrocodone plasma concentrations and prolong opioid adverse reactions.
- Concomitant use of hydrocodone bitartrate and homatropine methylbromide with CYP3A4 inducers or discontinuation of a CYP3A4 inhibitor could decrease hydrocodone plasma concentrations, decrease opioid efficacy or, possibly, lead to a withdrawal syndrome in a patient who had developed physical dependence to hydrocodone [see Warnings and Precautions (5.7)].
- Avoid the use of hydrocodone bitartrate and homatropine methylbromide in patients who are taking a CYP3A4 inhibitor or inducer. If concomitant use of hydrocodone bitartrate and homatropine methylbromide with a CYP3A4 inhibitor or inducer is necessary, monitor patients closely for signs and symptoms that may reflect opioid toxicity and opioid withdrawal [see Drug Interactions (7.2, 7.3)].

5.8 Risks from Concomitant Use with Benzodiazepines or other CNS Depressants

- Concomitant use of opioids, including hydrocodone bitartrate and homatropine methylbromide with benzodiazepines, or other CNS depressants, including alcohol, may result in profound sedation, respiratory depression, coma, and death. Avoid the use of these risks, avoid use of opioid cough medications in patients taking benzodiazepines, other CNS depressants, or alcohol [see Drug Interactions (7.1, 7.4)].
- Observational studies have demonstrated that concomitant use of opioid analgesics and benzodiazepines increases the risk of drug-related mortality compared to use of opioids alone. Because of similar pharmacologic properties, it is reasonable to expect similar risk with concomitant use of opioid cough medications and benzodiazepines, other CNS depressants, or alcohol.
- Advise both patients and healthcare providers about the risks of respiratory depression and sedation if hydrocodone bitartrate and homatropine methylbromide is used with benzodiazepines, alcohol, or other CNS depressants [see Patient Counseling Information (17)].
- Patients must not consume alcoholic beverages, or prescription or non-prescription products containing alcohol, while on hydrocodone bitartrate and homatropine methylbromide therapy. The co-ingestion of alcohol with hydrocodone bitartrate and homatropine methylbromide may result in increased plasma levels and a potentially fatal overdose of hydrocodone [see Drug Interactions (7.1)].

5.9 Risks of Use in Patients with Gastrointestinal Conditions

- Hydrocodone bitartrate and homatropine methylbromide is contraindicated in patients with known or suspected gastrointestinal obstruction, including paralytic ileus

Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements.

Taking hydrocodone bitartrate and homatropine methylbromide with certain other medicines can cause side effects or affect how well hydrocodone bitartrate and homatropine methylbromide or the other medicines work.

Do not start or stop taking other medicines without talking to your healthcare provider.

Especially tell your healthcare provider if you:

- take pain medicines such as opioids (narcotics).
- take cold or allergy medicines that contain antihistamines or cough suppressants.
- drink alcohol.
- take muscle relaxants.
- take certain medicines used to treat mood, anxiety, psychotic or thought disorders, or depression, including monamine oxidase inhibitors (MAOIs), tricyclics, selective serotonin reuptake inhibitors (SSRIs), selective serotonin-norepinephrine reuptake inhibitors (SNRIs), or antipsychotics.
- take medicines to lower your blood pressure.
- take water pills (diuretics).
- take medicines called "anticholinergics" used to treat certain health problems including asthma, chronic obstructive pulmonary disease (COPD), or stomach problems.

Ask your healthcare provider if you are not sure if you take one of these medicines.

How should I take hydrocodone bitartrate and homatropine methylbromide?

- See **“What is the most important information I should know about hydrocodone bitartrate and homatropine methylbromide?”**

- Take hydrocodone bitartrate and homatropine methylbromide exactly as your healthcare provider tells you to take it. Do not change your dose without talking to your health care provider.
- Take hydrocodone bitartrate and homatropine methylbromide by mouth only.
- Take hydrocodone bitartrate and homatropine methylbromide oral solution using an accurate milliliter (mL) measuring device. If you do not have one, ask your pharmacist to give you a measuring device to help you measure the correct amount of hydrocodone bitartrate and homatropine methylbromide oral solution. **Do not use a household teaspoon to measure your medicine. You may accidentally take too much.**
- **Do not** overfill the measuring device.
- Rinse the measuring device with water after each use.
- If you take too much hydrocodone bitartrate and homatropine methylbromide, call your healthcare provider or go to the nearest hospital emergency room right away.
- Tell your healthcare provider if your cough does not get better within 5 days of treatment with hydrocodone bitartrate and homatropine methylbromide.

What should I avoid while taking hydrocodone bitartrate and homatropine methylbromide?

- Avoid driving a car or operating machinery during treatment with hydrocodone bitartrate and homatropine methylbromide. Hydrocodone bitartrate and homatropine methylbromide can cause you to be drowsy, slow your thinking and motor skills, and affect your vision.
- **Do not** drink alcohol during treatment with hydrocodone bitartrate and homatropine methylbromide. Drinking alcohol can increase your chances of having serious side effects.

Avoid the use of hydrocodone bitartrate and homatropine methylbromide if you:

- are pregnant. Use of hydrocodone bitartrate and homatropine methylbromide during pregnancy can cause withdrawal symptoms in your newborn baby that could be life-threatening if not recognized and treated. Tell your healthcare provider right away if you are pregnant or think you may be pregnant.
- are breastfeeding. Use of hydrocodone bitartrate and homatropine methylbromide while breastfeeding can cause severe breathing problems (respiratory depression) in your breastfed infant that could be life-threatening.
- take a medicine called a monoamine oxidase inhibitor (MAOI). Avoid taking an MAOI within 14 days after you stop taking hydrocodone bitartrate and homatropine methylbromide. Avoid starting hydrocodone bitartrate and homatropine methylbromide if you stopped taking an MAOI in the last 14 days.

What are the possible side effects of hydrocodone bitartrate and homatropine methylbromide?

Hydrocodone bitartrate and homatropine methylbromide can cause serious side effects, including:

- See **“What is the most important information I should know about hydrocodone bitartrate and homatropine methylbromide”**
- **Bowel problems including severe constipation or stomach pain.** See **“Who should not take hydrocodone bitartrate and homatropine methylbromide?”**
- **Increased pressure in your head (intracranial).** Avoid the use of hydrocodone bitartrate and homatropine methylbromide if you have a head injury or have been told that you have changes in the tissue of your brain (brain lesions) or increased pressure in your head.
- **Increased risk of seizures in people with seizure disorders.** If you have a seizure disorder, hydrocodone bitartrate and homatropine methylbromide may increase how often you have a seizure.
- **Low blood pressure.** A sudden drop in blood pressure can happen in some people during treatment with hydrocodone bitartrate and homatropine methylbromide and this may cause you to feel dizzy, faint, lightheaded, or weak, especially when you stand up (orthostatic hypotension). Your risk of having this problem may be increased if you take hydrocodone bitartrate and homatropine methylbromide with certain other medicines that lower blood pressure. If you have any of these symptoms while taking hydrocodone bitartrate and homatropine methylbromide, sit or lie down. Do not change your body position too fast. Get up slowly from sitting or lying down.
- **Adrenal gland problems.** Hydrocodone bitartrate and homatropine methylbromide can cause serious and life-threatening adrenal gland problems. Your healthcare provider may do blood tests to check for adrenal gland problems. Call your healthcare provider right away if you have any of these symptoms:
 - nausea
 - vomiting
 - not wanting to eat (anorexia)
 - weakness
 - dizziness
 - low blood pressure
 - fatigue

The most common side effects of hydrocodone bitartrate and homatropine methylbromide include:

- sleepiness
- confusion
- coordination problems
- decrease in mental and physical performance
- lack of energy
- lightheadedness
- dizziness
- headache
- dry mouth
- nausea
- vomiting
- constipation

These are not all the possible side effects of hydrocodone bitartrate and homatropine methylbromide.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store hydrocodone bitartrate and homatropine methylbromide?

- Store hydrocodone bitartrate and homatropine methylbromide at room temperature between 68°F to 77°F (20°C to 25°C).
- Store hydrocodone bitartrate and homatropine methylbromide tablets in a tightly closed container, in a dry, cool place away from heat or direct sunlight.

- **Keep hydrocodone bitartrate and homatropine methylbromide and all medicines out of the reach of children.**

How should I dispose of hydrocodone bitartrate and homatropine methylbromide?

Remove unused hydrocodone bitartrate and homatropine methylbromide from the container and mix it with an undesirable, non-toxic substance such as cat litter or use coffee grounds to make it less appealing to children and pets. Place the mixture in a container such as a sealed plastic bag and throw it away in the household trash. You can also follow your state or local guidelines on how to safely throw away hydrocodone bitartrate and homatropine methylbromide.

General information about the safe and effective use of hydrocodone bitartrate and homatropine methylbromide.

Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. **Do not** use hydrocodone bitartrate and homatropine methylbromide for a condition for which it was not prescribed. **Do not** give hydrocodone bitartrate and homatropine methylbromide to other people, even if they have the same symptoms that you have. It may harm them.

You can ask your pharmacist or healthcare provider for information about hydrocodone bitartrate and homatropine methylbromide that is written for health professionals.

What are the ingredients in hydrocodone bitartrate and homatropine methylbromide?

Active ingredients: hydrocodone bitartrate and homatropine methylbromide

Inactive ingredients in hydrocodone bitartrate and homatropine methylbromide tablets: calcium phosphate dibasic, colloidal silicon dioxide, lactose, magnesium stearate, pregelatinized starch and stearic acid.

Inactive ingredients in hydrocodone bitartrate and homatropine methylbromide oral solution: anhydrous citric acid, FD&C Red 40, methylparaben, natural and artificial cherry flavor, propylparaben, purified water, sorbitol solution, sodium citrate dihydrate and sucrose.

Manufactured by: Genus Lifesciences Inc., Allentown, PA 18102

For more information, go to www.genuslifesciences.com or call 1-866-511-6754.

This Medication Guide has been approved by the U.S. Food and Drug Administration.

Revised: 06/2022

5.15 Drug/Laboratory Test Interactions

Because opioid agonists may increase biliary tract pressure, with resultant increase in plasma amylase and lipase levels, determination of these enzyme levels may be unreliable for 24 hours after administration of a dose of hydrocodone bitartrate and homatropine methylbromide.

6 ADVERSE REACTIONS

The following clinically significant adverse reactions are described elsewhere in labeling:

- Addiction, abuse, and misuse [see *Warnings and Precautions* (5.1), *Drug Abuse and Dependence* (9.3)]
- Life-threatening respiratory depression [see *Warnings and Precautions* (5.2, 5.3, 5.4, 5.4, 5.8), *Overdose* (10)]
- Accidental overdose and death due to medication errors [see *Warnings and Precautions* (5.5)]
- Decreased mental alertness with impaired mental and/or physical abilities [see *Warnings and Precautions* (5.6)]
- Interactions with benzodiazepines and other CNS depressants [see *Warnings and Precautions* (5.8), *Drug Interactions* (7.1, 7.4)]
- Paralytic ileus, gastrointestinal adverse reactions [see *Warnings and Precautions* (5.9)]
- Increased intracranial pressure [see *Warnings and Precautions* (5.10)]
- Obscured clinical course in patients with head injuries [see *Warnings and Precautions* (5.10)]
- Seizures [see *Warnings and Precautions* (5.11)]
- Severe hypotension [see *Warnings and Precautions* (5.12)]
- Neonatal Opioid Withdrawal Syndrome [see *Warnings and Precautions* (5.13)]
- Adrenal insufficiency [see *Warnings and Precautions* (5.14)]

The following adverse reactions have been identified during clinical studies, in the literature, or during post-approval use of hydrocodone bitartrate and homatropine methylbromide. Because these reactions may be reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

The most common adverse reactions to hydrocodone bitartrate and homatropine methylbromide include: Sedation (somnolence, mental clouding, lethargy), impaired mental and physical performance, lightheadedness, dizziness, headache, dry mouth, nausea, vomiting, and constipation.

Other reactions include:

- Anaphylaxis: Anaphylaxis has been reported with hydrocodone, one of the ingredients in hydrocodone bitartrate and homatropine methylbromide.
- Body as a whole: Coma, death, fatigue, falling injuries, lethargy.
- Cardiovascular: Peripheral edema, increased blood pressure, decreased blood pressure, tachycardia, and death in a breastfed infant, advice patients that breastfeeding is not recommended during treatment with hydrocodone bitartrate and homatropine methylbromide.
- Central Nervous System: Facial dyskinesia, insomnia, migraine, increased intracranial pressure, seizure, tremor.
- Dermatologic: Flushing, hyperhidrosis, pruritus, rash.
- Endocrine/Metabolic: Cases of serotonin syndrome, a potentially life-threatening condition, have been reported during concurrent use with serotonergic drugs. Cases of adrenal insufficiency have been reported with opioid use, more often following greater than one month of use. Cases of androgen deficiency have occurred with chronic use of opioids.
- Gastrointestinal: Abdominal pain, bowel obstruction, decreased appetite, diarrhea, difficulty swallowing, dry mouth, GERD, indigestion, pancreatitis, paralytic ileus, biliary tract spasm (spasm of the sphincter of Oddi), constipation.
- Genitourinary: Urinary tract infection, ureteral spasm, spasm of vesicle sphincters, urinary retention.
- Laboratory: Increases in serum amylase.
- Musculoskeletal: Arthralgia, backache, muscle spasm.
- Ophthalmic: Miosis (constricted pupils), visual disturbances.
- Psychiatric: Agitation, anxiety, confusion, fear, dysphoria, depression.
- Reproductive: Hypogonadism, infertility.
- Respiratory: Bronchitis, cough, dyspnea, nasal congestion, nasopharyngitis, respiratory depression, sinusitis, upper respiratory tract infection.
- Other: Drug abuse, drug dependence, opioid withdrawal syndrome.

7 DRUG INTERACTIONS

No specific drug interaction studies have been conducted with hydrocodone bitartrate and homatropine methylbromide.

7.1 Alcohol

Concomitant use of alcohol with hydrocodone bitartrate and homatropine methylbromide can result in an increase of hydrocodone plasma levels and potentially fatal overdose of hydrocodone. Instruct patients not to consume alcoholic beverages or use prescription or nonprescription products containing alcohol while taking hydrocodone bitartrate and homatropine methylbromide.

7.2 Inhibitors of CYP3A4 and CYP2D6

The concomitant use of hydrocodone bitartrate and homatropine methylbromide and CYP3A4 inhibitors, such as macrolide antibiotics (e.g., erythromycin), azole-antifungal agents (e.g., ketoconazole), or protease inhibitors (e.g., ritonavir) can increase the plasma concentration of hydrocodone, resulting in increased or prolonged opioid effects. These effects could be more pronounced with concomitant use of hydrocodone bitartrate and homatropine methylbromide and CYP2D6 and CYP3A4 inhibitors, particularly when hydrocodone bitartrate and homatropine methylbromide is added after a stable dose of hydrocodone bitartrate and homatropine methylbromide is achieved [see *Warnings and Precautions* (5.7)]. After stopping a CYP3A4 inhibitor, as the effects of the inhibitor decline, the hydrocodone plasma concentration will decrease [see *Clinical Pharmacology* (12.3)], resulting in decreased opioid efficacy or a withdrawal syndrome in patients who had developed physical dependence to hydrocodone.

Avoid the use of hydrocodone bitartrate and homatropine methylbromide while taking a CYP3A4 or CYP2D6 inhibitor. If concomitant use is necessary, monitor patients for respiratory depression and sedation [see *Warnings and Precautions* (5.1), *Drug Interactions* (7.1), *Adverse Reactions* (6.1), *Overdose* (10)].

7.3 CYP3A4 Inducers

The concomitant use of hydrocodone bitartrate and homatropine methylbromide and CYP3A4 inducers such as rifampin, carbamazepine, or phenytoin, can decrease the plasma concentration of hydrocodone [see *Clinical Pharmacology* (12.3)], resulting in decreased efficacy or onset of a withdrawal syndrome in patients who have developed physical dependence to hydrocodone [see *Warnings and Precautions* (5.7)]. After stopping a CYP3A4 inducer, as the effects of the inducer decline, the hydrocodone plasma concentration will increase [see *Clinical Pharmacology* (12.3)], which could increase or prolong both the duration of opioid effects and adverse reactions, and cause serious respiratory depression.

Avoid the use of hydrocodone bitartrate and homatropine methylbromide in patients who are taking CYP3A4 inducers. If concomitant use of a CYP3A4 inducer is necessary, follow the patient for reduced opioid efficacy.

7.4 Benzodiazepines, and Other CNS Depressants

The concomitant use of hydrocodone bitartrate and homatropine methylbromide with other CNS depressants, including alcohol, other sedatives/hypnotics, anxiolytics, tranquilizers, muscle relaxants, general anesthetics, antipsychotics, and other opioids, can increase the risk of hypotension, respiratory depression, profound sedation, coma, and death. Avoid the use of hydrocodone bitartrate and homatropine methylbromide in patients who are taking benzodiazepines or other CNS depressants [see *Warnings and Precautions* (5.8)] and instruct patients to avoid consumption of alcohol while on hydrocodone bitartrate and homatropine methylbromide [see *Drug Interactions* (7.1), *Patient Counseling Information* (17)].

7.5 Serotonergic Drugs

The concomitant use of opioids with other drugs that affect the serotonergic neurotransmitter system has resulted in serotonin syndrome. If concomitant use is warranted, carefully observe the patient, particularly during treatment initiation. Discontinue hydrocodone bitartrate and homatropine methylbromide if serotonin syndrome is suspected.

7.6 Monoamine Oxidase Inhibitors (MAOIs)

Avoid the use of hydrocodone bitartrate and homatropine methylbromide in patients who are taking monoamine oxidase inhibitors (MAOIs) or have taken MAOIs within 14 days. The use of MAOIs or tricyclic antidepressants with hydrocodone, one of the active ingredients in hydrocodone bitartrate and homatropine methylbromide, may increase the effect of either the antidepressant or hydrocodone. MAOI interactions with opioids may manifest as serotonin syndrome or opioid toxicity (e.g., respiratory depression, coma).

7.7 Muscle Relaxants

Hydrocodone may enhance the neuromuscular blocking action of skeletal muscle relaxants and produce an increased degree of respiratory depression. Avoid the use of hydrocodone bitartrate and homatropine methylbromide in patients taking muscle relaxants. If concomitant use is necessary, monitor patients for signs of respiratory depression that may be greater than otherwise expected.

7.8 Diuretics

Opioids can reduce the efficacy of diuretics by inducing the release of antidiuretic hormone. Monitor patients for signs of diminished diuresis and/or effects on blood pressure and increase the dosage of the diuretic as needed.

7.9 Anticholinergic Drugs

The concomitant use of anticholinergic drugs with hydrocodone bitartrate and homatropine methylbromide may increase risk of urinary retention and/or severe constipation, which may lead to paralytic ileus [see *Warnings and Precautions* (5.9)]. Monitor patients for signs of urinary retention or reduced gastric motility when hydrocodone bitartrate and homatropine methylbromide is used concomitantly with anticholinergic drugs.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

BK Summary:

Hydrocodone bitartrate and homatropine methylbromide is not recommended for use in pregnant women, including during or immediately prior to labor.

Prolonged use of opioids during pregnancy may cause neonatal opioid withdrawal syndrome [see *Warnings and Precautions* (5.13), *Clinical Considerations*].

There are no available data with hydrocodone bitartrate and homatropine methylbromide use in pregnant women to inform a drug-associated risk for adverse developmental outcomes. Published studies with hydrocodone have reported inconsistent findings and have important methodological limitations [see *Data*].

In animal reproduction studies, hydrocodone administered by the subcutaneous route to pregnant hamsters during the period of organogenesis produced a teratogenic effect at a dose approximately 45 times the maximum recommended human dose (MRHD) [see *Data*].

Based on the animal data, advise pregnant women of the potential risk to a fetus.

The estimated background risk of major birth defects and miscarriage for the indicated population is unknown. All pregnancies have a background risk of birth defect, loss, or other adverse outcome. In the U.S. general population, the estimated background risk of major birth defects and miscarriage is evaluated prior to reflux [see *Use and Administration* (2.3), *Warnings and Precautions* (5.1)].

Clinical Considerations

Fetal/Neonatal Adverse Reactions

Prolonged use of opioid analgesics during pregnancy for medical or nonmedical purposes can result in physical dependence in the neonate and neonatal opioid withdrawal syndrome shortly after birth.

Neonatal opioid withdrawal syndrome presents as irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea and failure to gain weight. The onset, duration, and severity of neonatal sleep opioid withdrawal syndrome vary based on the specific opioid used, duration of use, timing and amount of last maternal use, and rate of elimination of the drug by the newborn. Observe newborns for symptoms of neonatal opioid withdrawal syndrome and manage accordingly [see *Warnings and Precautions* (5.13)].

Labor or Delivery

Opioids cross the placenta and may produce respiratory depression and psycho-physiologic effects in neonates. An opioid antagonist, such as naloxone, must be available for reversal of opioid-induced respiratory depression in the neonate. Opioids, including hydrocodone bitartrate and homatropine methylbromide, can prolong labor through actions which temporarily reduce the strength, duration, and frequency of uterine contractions. However, this effect is not consistent and may be offset by an increased rate of cervical dilation, which tends to shorten labor. Monitor neonates exposed to opioids during labor for signs of excess sedation and respiratory depression.

Data

Human Data

Hydrocodone

A limited number of pregnancies have been reported in published observational studies and postmarketing reports describing hydrocodone use during pregnancy. However, these data could not definitively establish or exclude any drug-associated risk during pregnancy. Methodological limitations of these observational studies include small sample size and lack of details regarding dose, duration and timing of exposure.

Animal Data

Reproductive toxicity studies have not been conducted with hydrocodone bitartrate and homatropine methylbromide; however, studies are available with individual active ingredients or related active ingredients.

Hydrocodone

In an embryofetal development study in pregnant hamsters on gestation day 8 during the period of organogenesis, hydrocodone induced cranioschisis, a malformation, at approximately 45 times the MRHD (on a mg/m² basis with a maternal subcutaneous dose of 102 mg/kg). Reproductive toxicity studies are also conducted with codeine, an opioid related to hydrocodone. In an embryofetal development study in pregnant rats throughout the period of organogenesis, doses approximately 30 and 160 times, respectively, the MRHD of hydrocodone (on a mg/m² basis with maternal oral dose of codeine at 30 mg/kg/day in rabbits and 600 mg/kg/day in mice), these effects occurred in the presence of maternal toxicity. In embryofetal development studies with pregnant rabbits and mice dosed throughout the period of organogenesis, codeine produced no adverse developmental effects at doses approximately 30 and 160 times, respectively, the MRHD of hydrocodone (on a mg/m² basis with maternal oral dose of codeine at 30 mg/kg/day in rabbits and 600 mg/kg/day in mice).

Homatropine

Animal studies with homatropine are not available.

8.2 Lactation

Risk Summary:

Because of the potential for serious adverse reactions, including excess sedation, respiratory depression, and death in a breastfed infant, advise patients that breastfeeding is not recommended during treatment with hydrocodone bitartrate and homatropine methylbromide.

There are no data on the presence of hydrocodone bitartrate and homatropine methylbromide in human milk. If the effects of hydrocodone bitartrate and homatropine methylbromide on the breastfed infant, or the effects of hydrocodone bitartrate and homatropine methylbromide on milk production; however, data are available with hydrocodone and homatropine.

Homatropine

Animal studies with homatropine are not available.

8.3 Females and Males of Reproductive Potential

Infertility

Chronic use of opioids, such as hydrocodone, a component of hydrocodone bitartrate and homatropine methylbromide, may cause reduced fertility in females and males of reproductive potential. It is not known whether these effects on fertility are reversible [see *Adverse Reactions* (6), *Clinical Pharmacology* (12.2)].

Hydrocodone

Hydrocodone is present in breast milk. Published cases report variable concentrations of hydrocodone and homatropine (on an intact milk) in breast milk with administration of immediate-release hydrocodone to nursing mothers in the early post-partum period with relative infant doses of hydrocodone ranging between 1.4% and 3.7%. There are case reports of excessive sedation and respiratory depression in breastfed infants exposed to hydrocodone. No information is available on the effects of hydrocodone on milk production.

Homatropine

No information is available on the levels of homatropine in breast milk or on milk production. The published literature suggests that homatropine may decrease milk production based on its anticholinergic effects [see *Clinical Considerations*].

Infants exposed to hydrocodone bitartrate and homatropine methylbromide through breast milk should be monitored for excess sedation and respiratory depression. Withdrawal symptoms can occur in breastfed infants when maternal administration of an opioid is stopped, or when breastfeeding is stopped.

8.4 Pediatric Use

Hydrocodone bitartrate and homatropine methylbromide is contraindicated in pediatric patients younger than 6 years of age because of life-threatening respiratory depression and death have occurred in pediatric patients who received hydrocodone [see *Contraindications* (4), *Warnings and Precautions* (5.2)].

The safety and effectiveness of hydrocodone bitartrate and homatropine methylbromide has not been established in patients younger than 18 years of age. Hydrocodone bitartrate and homatropine methylbromide is not recommended for use in patients younger than 18 years of age because the benefits of symptomatic treatment of cough associated with allergies or the common cold do not outweigh the risks for use of hydrocodone in these patients [see *Indications* (1), *Warnings and Precautions* (5.3)].

8.5 Geriatric Use

Clinical studies have not been conducted with hydrocodone bitartrate and homatropine methylbromide in geriatric populations.

Use caution when considering the use of hydrocodone bitartrate and homatropine methylbromide in patients 65 years of age or older. Elderly patients may have increased sensitivity to hydrocodone; greater frequency of decreased bowel, renal, or cardiac function; or concomitant disease or other drug therapy [see *Warnings and Precautions* (5.4)].

Respiratory depression is the chief risk for elderly patients treated with opioids, including hydrocodone bitartrate and homatropine methylbromide. Respiratory depression has occurred after large initial doses of opioids were administered to patients who were not opioid-tolerant or when opioids were co-administered with other agents that depress respiration [see *Warnings and Precautions* (5.4, 5.8)].

Hydrocodone is known to be substantially excreted by the kidney, and the risk of adverse reactions to this drug may be greater in patients with impaired renal function. Because elderly patients are more likely to have decreased renal function, monitor these patients closely for respiratory depression, sedation, and hypotension.

8.6 Renal Impairment

The pharmacokinetics of hydrocodone bitartrate and homatropine methylbromide has not been characterized in patients with renal impairment. Patients with impairment may have higher plasma concentrations of these with normal function [see *Clinical Pharmacology* (12.3)]. Hydrocodone bitartrate and homatropine methylbromide should be used with caution in patients with severe impairment of renal function, and patients should be monitored closely for respiratory depression, sedation, and hypotension.

8.7 Hepatic Impairment

The pharmacokinetics of hydrocodone bitartrate and homatropine methylbromide has not been characterized in patients with hepatic impairment. Patients with severe hepatic impairment may have higher plasma concentrations than those with normal hepatic function [see *Clinical Pharmacology* (12.3)].

Therefore, hydrocodone bitartrate and homatropine methylbromide should be used with caution in patients with severe impairment of hepatic function, and patients should be monitored closely for respiratory depression, sedation, and hypotension.

8.8 Abuse and Dependence

9 Controlled Substance

Hydrocodone bitartrate and homatropine methylbromide contains hydrocodone, a Schedule II controlled substance.

9.2 Abuse

Hydrocodone

Hydrocodone bitartrate and homatropine methylbromide contains hydrocodone, a substance with a high potential for abuse similar to other opioids including morphine and codeine. Hydrocodone bitartrate and homatropine methylbromide can be abused and is subject to misuse, addiction, and criminal diversion [see *Warnings and Precautions* (5.1)].

All patients treated with opioids require careful monitoring for signs of abuse and addiction. Since use of opioid analgesics carries a risk of addiction, prescribers should be aware that addiction may develop even when appropriate medical care is provided. Prescribers should be aware that addiction may develop even when appropriate medical care is provided.

Prescription drug abuse is the intentional non-therapeutic use of a prescription drug, even once, for its rewarding psychological or physiological effects.

“Drug-seeking” behavior is very common in persons with substance use disorders. Drug-seeking tactics include emergency calls or visits near the end of office hours, refusal to undergo appropriate examination, testing, or referral, repeated “loss” of prescriptions, tampering with prescriptions, and reluctance to provide prior medical records or contact information to other healthcare providers. Some patients are able to obtain prescriptions through multiple pharmacies to obtain additional prescriptions is common among drug abusers and people suffering from untreated addiction. Precaution with achieving adequate pain relief can be appropriate behavior in a patient with poor pain control.

Abuse and addiction are separate and distinct from physical dependence and tolerance. Health care providers should be aware that addiction may develop even when appropriate medical care is provided.

Physical dependence in all addicts. In addition, abuse of opioids can occur in the absence of true addiction. Hydrocodone bitartrate and homatropine methylbromide, like other opioids, can be diverted for non-medical use into illicit channels of distribution. Careful record-keeping of prescribing information, including quantity, frequency, and renewal requests, as required by state and federal regulations, is important.

Proper assessment of the patient, proper prescribing practices, periodic re-evaluation of therapy, and proper dispensing and storage are appropriate measures that help to limit abuse of opioid drugs.

Risks Specific to Abuse of Hydrocodone Bitartrate and Homatropine Methylbromide

Hydrocodone bitartrate and homatropine methylbromide is for oral use only. Abuse of hydrocodone bitartrate and homatropine methylbromide poses a risk of overdose and death. The risk is increased with concurrent use of hydrocodone bitartrate and homatropine methylbromide with alcohol and other central nervous system depressants [see *Warnings and Precautions* (5.8), *Drug Interactions* (7.1, 7.4)].

Parenteral drug abuse is commonly associated with transmission of infectious diseases such as hepatitis and HIV.

9.3 Dependence

Psychological dependence, physical dependence, and tolerance may develop upon repeated administration
